DAP = days after planting

Make no more than 3 sequential applications of DuPont™ Fontelis® fungicide before switching to a fungicide with a different mode of action. Do not exceed 72 fl oz/A per year of Fontelis.

Develop a Peanut Rx

For each of the following factors that influence the incidence of TSWV or fungal diseases, the grower or consultant should identify which option best describes the situation for each peanut field. An option must be selected for each risk factor unless the information is “unknown.” A score of “0” for any variable does not imply “no risk”, but that this practice does not increase disease risk. Add the index numbers associated with each choice to obtain an overall risk index value. Compare that number to the risk scale provided and identify the projected level of risk.

Step 2: Calculate Your Risk

Add your index values from:				
	Points			
	Spotted Wilt	Leaf Spot	White Mold	Rhizoctonia Limb Rot
Peanut Variety				
Planting Date				
Plant Population		—		—
At-Plant Insecticide		—	—	—
Row Pattern

Your Total Index Value				

Step 3: Risk Category

Add your index values from:				
	Points		Soil-borne Disease Points	
	Spotted Wilt	Leaf Spot	White Mold	Limb Rot
High Risk	≥ 115	65–100	55–80	TBD
Medium Risk	70–110	40–60	30–50	TBD
Low Risk	≤ 65	10–35	10–25	TBD

Step 4: Choose a Peanut Rx Spray Program

After determining your risk level for each fungal disease, use the most conservative fungicide program as a base for developing your per-field prescription spray program.

The Peanut Disease Risk Index, developed by research and extension faculty at the University of Georgia, the University of Florida, Auburn University, and Mississippi State University is officially known as “PEANUT Rx.” To view the fully updated 2019 version of PEANUT Rx by the authors based upon data and observations from the 2018 season, and access the online calculator, visit www.ugapeanuts.com.

¹ Adequate research data is not available for all varieties with regards to all diseases. Additional varieties will be included as data to support the assignment of an index value are available.

² High-oleic variety.

³ Variety Bailey have increased resistance to Cylindrocladium black rot (CBR) than do other varieties commonly planted in Georgia.

⁴ Tifguard, TifNV-HiOL and Georgia-14N have excellent resistance to the peanut root-knot nematode.

⁵ Georgia-12Y appears to have increased risk to Rhizoctonia limb rot and precautions should be taken to protect against this disease.
