GANE AND SPUR PRUNING Pruning is a critical cultural practice for grapevines. It controls vine growth, improves air circulation, and increases sunlight penetration to the leaves and fruit. Pruning should be done in the dormant season.	FROST DAMAGE Frost damage can occur during bud break and bloom. Symptoms include leaf curling, necrosis, and dieback. Prevention includes frost protection techniques like covering or wind machines.	SHOOT THINNING Shoot thinning is the removal of excess vegetative shoots to improve canopy structure and fruit quality. It should be done during the prebloom and bloom stages.	SAMPLING Sampling is used to monitor vine growth and fruit development. It involves taking representative samples from different parts of the vineyard.	LEAF REMOVAL Leaf removal is the selective removal of leaves to improve air circulation and sunlight penetration to the fruit. It should be done during the fruit set and BB-sized fruit stages.	LEAF REMOVAL Leaf removal is the selective removal of leaves to improve air circulation and sunlight penetration to the fruit. It should be done during the pea-sized fruit and berry touch stages.	SAMPLING Sampling is used to monitor vine growth and fruit development. It involves taking representative samples from different parts of the vineyard. CULTURAL PRACTICES
 Whether of practices optimize vineyard health, or vitability, and sustainability and improve crop quantity and quality. Like most management, viticultural practices should be implemented a timely fashion throughout the growing season to maximize practice efficiency and overall gain.

DORMANT	BUD SWELL	BUD BREAK AND NEW SHOOT SPRAYS*	PREBLOOM	BLOOM	POSTBLOOM*	FRUIT SET*	EARLY COVER SPRAYS*	BERRY TOUCH AND BUNCH CLOSURE*	LATE COVER SPRAYS*	VERAISON	PREHARVEST	POSTHARVEST*
---------	-----------	---------------------------------	----------	-------	------------	------------	---------------------	--------------------------------	--------------------	----------	------------	--------------

Bacterial blight A bacterial disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Xanthomonas vitae</i> .	Crown gall A tumor-forming disease caused by the bacterium <i>Bacterium vitae</i> . It results in the formation of galls on the roots and trunk.	Anthracnose A fungal disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Colletotrichum gloeosporioides</i> .	Phomopsis A fungal disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Phomopsis viticola</i> .	Powdery mildew A fungal disease that causes white powdery growth on leaves, clusters, and fruit. It is caused by <i>Oidium asperum</i> .	Downy mildew A fungal disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Plasmopara viticola</i> .	Black rot A fungal disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Botrytis cinerea</i> .	Bacterial blight A bacterial disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Xanthomonas vitae</i> .	Ripe rot A fungal disease that causes necrotic lesions on clusters and fruit. It is caused by <i>Botrytis cinerea</i> .	Bacterial blight A bacterial disease that causes necrotic lesions on leaves, clusters, and fruit. It is caused by <i>Xanthomonas vitae</i> .	Sour rot A fungal disease that causes necrotic lesions on clusters and fruit. It is caused by <i>Botrytis cinerea</i> .		

DISEASES
 Disease control in grapes is critical, as grapes are susceptible to a wide range of pathogens. Implementing timely and adequate cultural practices will greatly help to suppress diseases. In addition, grapes, more so than many horticultural commodities, require aggressive fungicide programs throughout the year to maintain vine health. Tailored strategies for the disease and pest management are not just a single stage disease in the Eastern Regional Beach State Integrated Management Book.

Mealybug A pest that causes damage to grapevines by sucking sap and secreting honeydew. It is caused by <i>Phylloxera vitifoliae</i> .	Sharpshooter/Leaftopper Pests that cause damage to grapevines by sucking sap and feeding on leaves. They are caused by <i>Homalotylus</i> and <i>Macrostelus</i> .	Mite A pest that causes damage to grapevines by sucking sap and causing leaf curling. It is caused by <i>Tetranychus</i> .	Climbing Cutworm A pest that causes damage to grapevines by feeding on leaves and stems. It is caused by <i>Agrotis</i> .	Grape Flea Beetle A pest that causes damage to grapevines by feeding on leaves and stems. It is caused by <i>Chalcidius</i> .	Thrips A pest that causes damage to grapevines by sucking sap and causing leaf curling. It is caused by <i>Frankliniella</i> .	Mite A pest that causes damage to grapevines by sucking sap and causing leaf curling. It is caused by <i>Tetranychus</i> .	Sharpshooter/Leaftopper Pests that cause damage to grapevines by sucking sap and feeding on leaves. They are caused by <i>Homalotylus</i> and <i>Macrostelus</i> .	Grape Root Borer A pest that causes damage to grapevines by boring into the roots. It is caused by <i>Phloeoborophagus</i> .	Spotted Wing Drosophila (SWD) A pest that causes damage to grapevines by feeding on clusters and fruit. It is caused by <i>Drosophila</i> .	Yellow Jacket A pest that causes damage to grapevines by stinging the fruit and leaves. It is caused by <i>Vespa</i> .

INSECTS
 Integrated pest management in the vineyard combines a variety of techniques and tools to control pests. It starts with correctly identifying the insect and understanding its timing.

Common Grape Pests

1. Grape flea beetle

2. Grape phylloxera

3. Grape mealybugs

4. Thrips

5. Leafhoppers / sharpshooters
(for Pierce's disease)

6. Grape berry moth

7. Mites

8. Japanese beetles

9. Grape root borer

10. Spotted wing drosophila

Monitoring and biology of pests

Grape flea beetle

- Metallic blue-green beetle, ~1/5 in long
 - Adults feed on the unfolding leaves
 - Eat holes into the sides of buds and gouge out the contents as the buds swell
- Larvae are brown with black spots, 3/8 in
 - Larvae feed on grape leaves for 3-4 weeks
- Monitor:
 - Active early in the spring on warm, sunny days
 - Shiny beetles easily spotted on buds and canes
 - Survey **25 vines** at each of the five locations
 - Bud damage **4% or more** → management needed

Grape phylloxera

- Native to eastern US
- Tiny, pale yellow sap-sucking insects
- Feed on the leaves and roots
 - Create galls on leaves and roots
 - Stunting and/or death of European varieties
- The mobile crawler stage of phylloxera is susceptible to insecticide treatment
- Resistant American root stocks are key

Grape mealybugs

- Flat, white, and oval shaped
 - Filaments along the perimeter of the body
 - Two especially long protruding from rear
- Become active in spring
 - Multiple generations a year
 - Populations are highest on vigorous vines
 - Generally more severe on late-ripening varieties
- Mealybugs can vector grapevine **leafroll virus**
- Honeydew supports the growth of sooty mold
- Monitoring:
 - Check under bark on spurs or loose bark of prunings
 - Sooty mold and/or ants indicate mealybugs
 - Pheromone traps can monitor adult males

Thrips

- Small, 0.04 inch long, with distinctive feathery wings
- **Western flower thrips** and **grape thrips** are the most important species
 - Western flower thrips populations peak in spring
 - Coinciding with grape bloom
 - Grape thrips populations peak in early summer
 - Coincides with peak vine growth
 - As growth slows, the numbers of thrips decreases
- Damage includes:
 - Stunted shoots and leaf stippling/necrosis
 - Halo-spotting on the fruit when they oviposit in berries
 - Scarring of berries with their feeding
- Generally not a problem in wine grapes

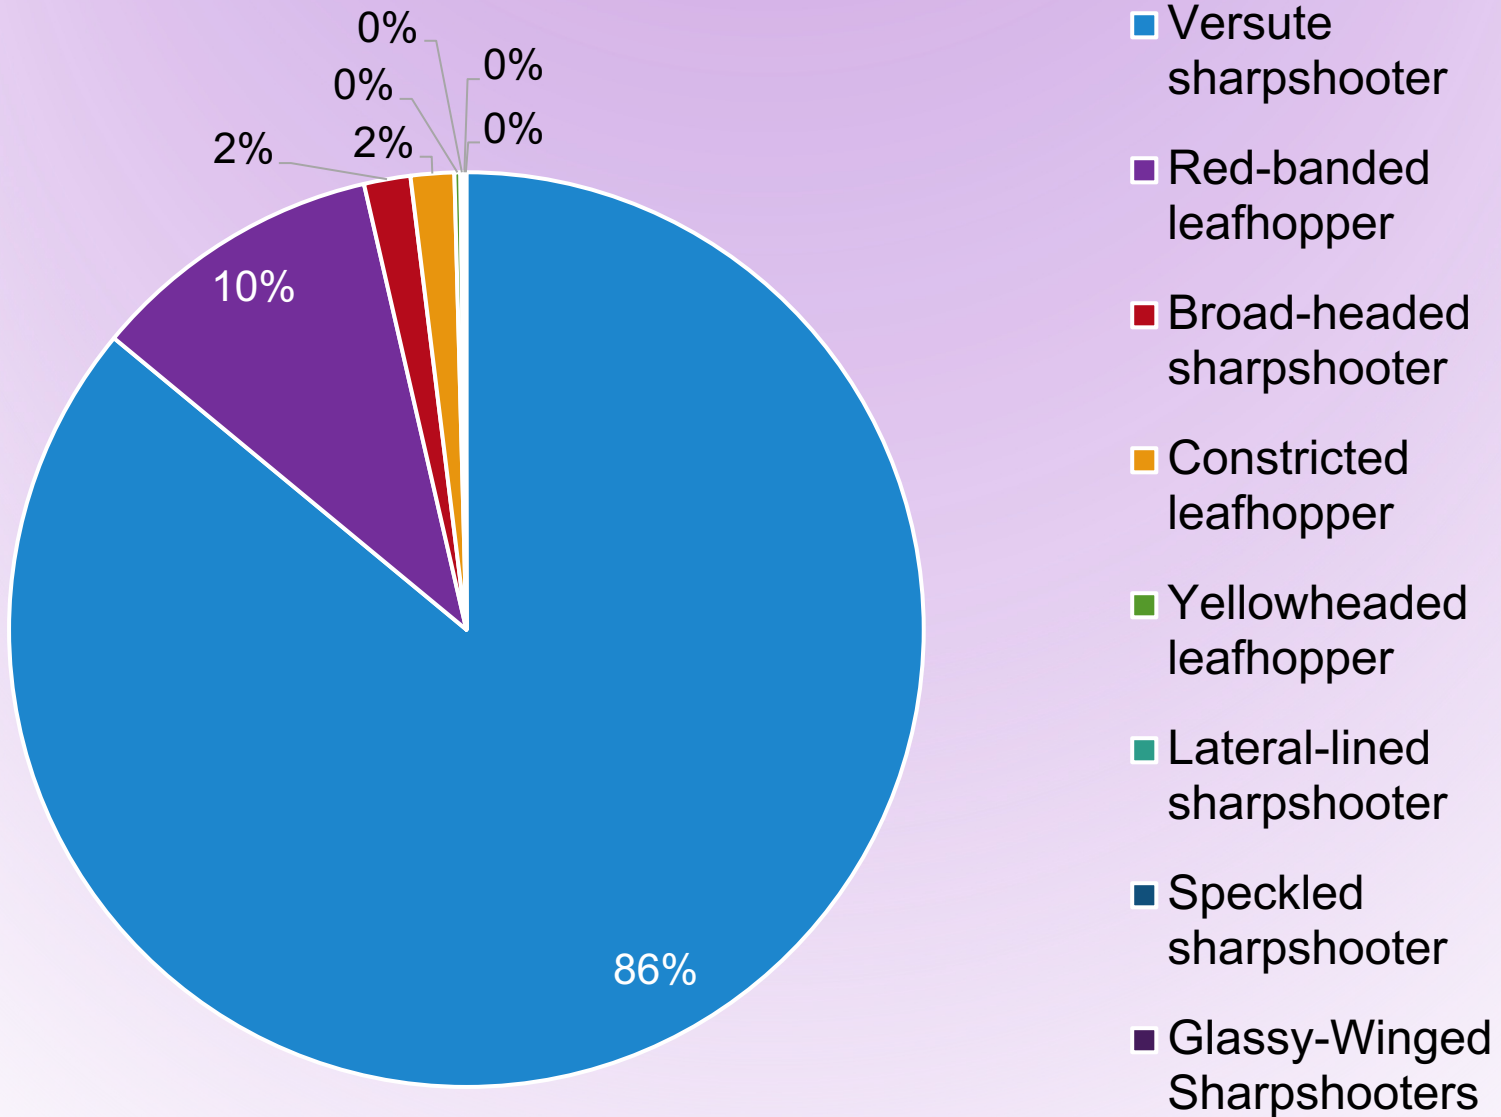

Leafhoppers / sharpshooters (for Pierce's disease)

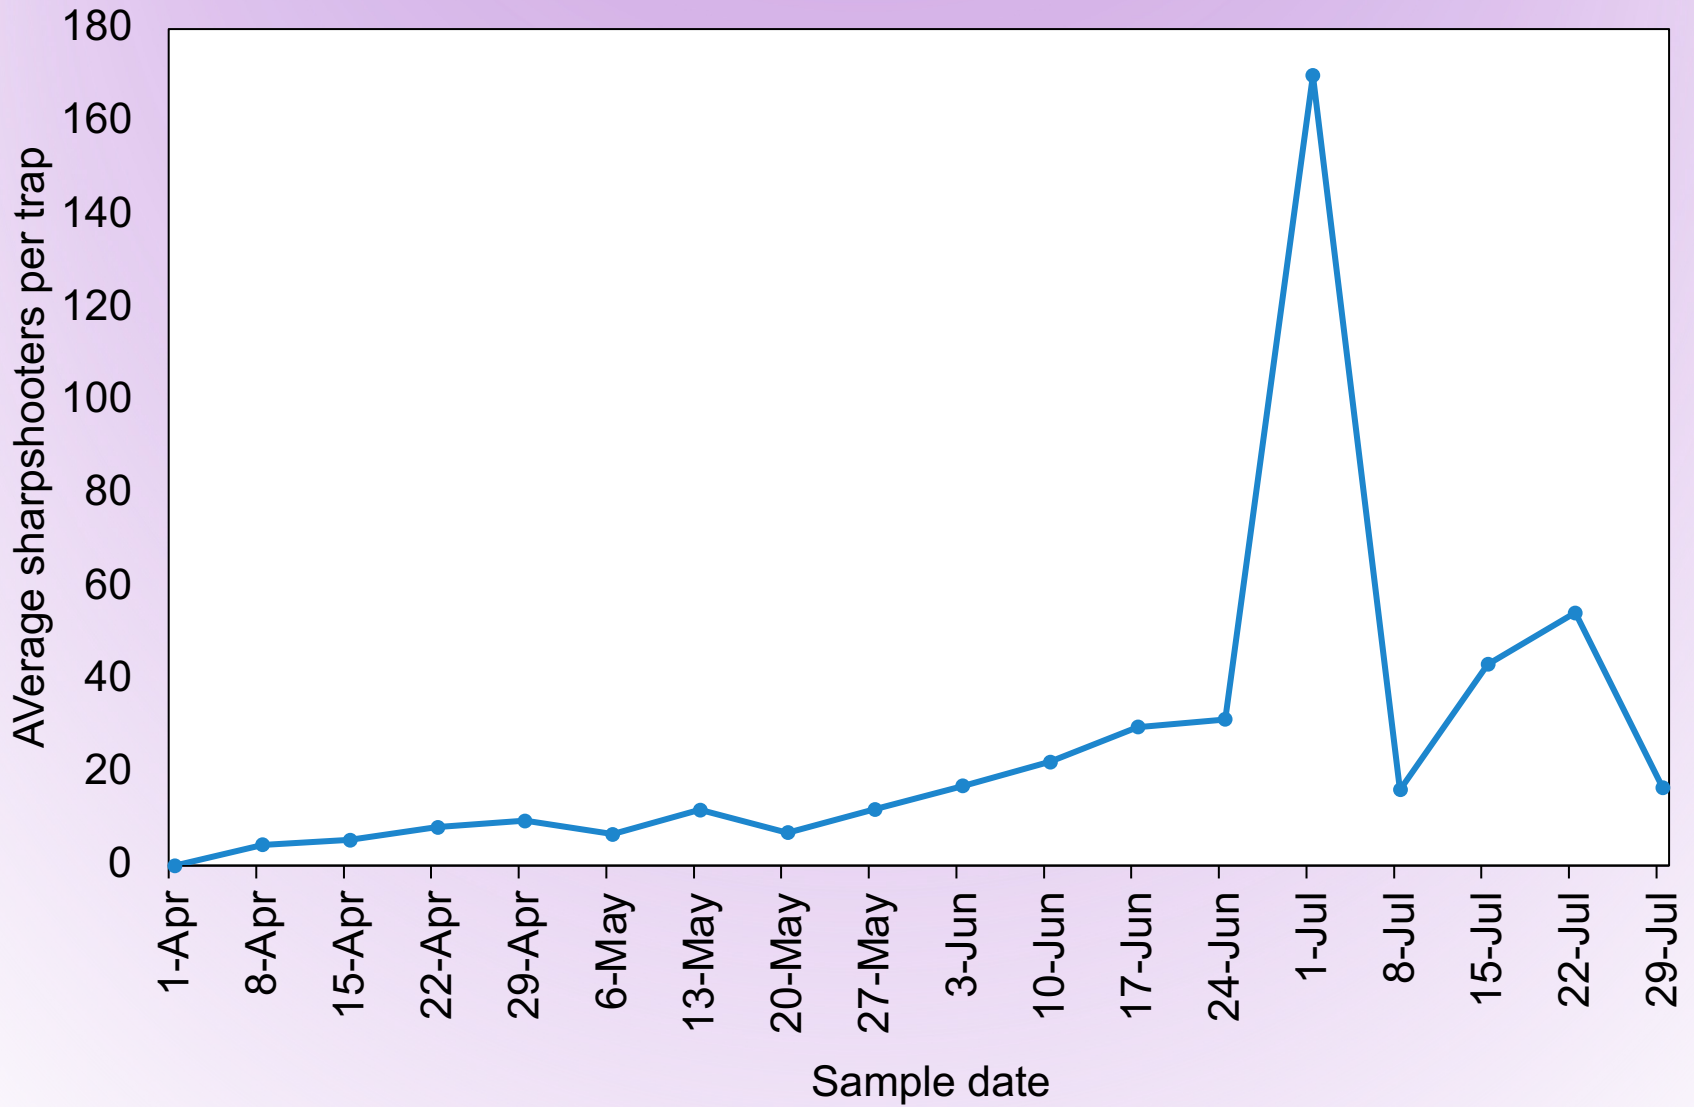

- Small insects with piercing-sucking mouthparts
 - Feed upon xylem or phloem tissue
 - Often cryptic in coloration – hard to visually monitor
 - Adults are expert jumpers and are strong flyers
- Potential to vector Pierce's disease of grapevines
 - Several culprits, including **glassy-winged sharpshooter**, **blue sharpshooter**, and **versute sharpshooter**
 - The causal agent is the bacterium *Xylella fastidiosa*
- Monitoring:
 - Begin at bud break
 - Use double-sided yellow sticky traps
 - Hang traps every 150 feet at canopy height
 - Check traps weekly

Sharpshooter/leafhopper community

Sharpshooter/leafhopper activity

Grape berry moth

- Adult moths, different shades of brown with grey saddle
 - Eggs laid on grape stems, blossom clusters, or berries
 - Larvae are cream, then gray-green, then purple when mature, 3/8 in long
 - Overwinter as pupae in silken cocoons in fallen leaves
- Economic damage is primarily to the berries
 - Larvae enter berries, creating tunnels (dark surface)
 - Create webbed clusters
- Monitoring
 - Pheromone available for monitoring
 - A prebloom generation may exist in some regions
 - 2nd generation near bloom time, with 3 or 4 gens
 - 50% emergence at 187, 869, and 1094 DD after first male catch

GBM activity

Mites

- **European red mite** (ERM), *Panonychus ulmi*,
- **Two-spotted spider mite** (TSM), *Tetranychus urticae*,
- Can be a major pest within vineyards
 - Leaves have mild chlorotic spots and become bronzed if populations are sufficiently high
 - Severe infestations may result in defoliation
 - No direct fruit injury → reduction in photosynthesis negatively affects fruit quality
 - May lead to reduced shoot growth and fruit bud in the following year

Mites

Two-spotted Spider Mite

European Red Mite

Monitoring for Mites

- During the dormant period:
 - Inspect vines for overwintering ERM eggs
 - Clusters of of tiny (less than 1/50 inch), red spheres
- Post-bloom:
 - Assess leaves for adult ERM and TSM mites
 - Use hand lens to inspect leaves
 - Tap branch and collect mites onto white sheet of paper
- Chemical control should be considered only if ERM exceed **10 ERM** and/or **5 TSM** per leaf

Japanese beetles

- Adults are shiny green with copper-colored elytra
 - Overwinter as white, C-shaped grubs
- Can be severe pest of grape during the summer
 - Skeletonize leaves, rarely feeding on berries
 - Gregarious; present in great numbers on a few vines
 - Feeding concentrated in the upper part of the canopy
 - Feeding **after veraison** may impact fruit quality
- Monitoring:
 - No specific threshold
 - Manage at about 15% of the leaves damaged
 - Or damage is found below top trellis wire

Grape root borer

- Adult moths resemble wasps
- Each female lays an average of 300 eggs
 - Only 1.5-2.7% survive
 - Larvae drop to the ground and tunnel into roots
 - The life cycle takes two years to complete
 - Full-grown larvae are about 1 in long, white, and have brown heads
 - Adults emerge from soil in early summer
- Damage reduces the productivity of the vine
 - Roots may be hollowed
 - A lack of plant vigor is usually the first sign
 - Vines eventually die

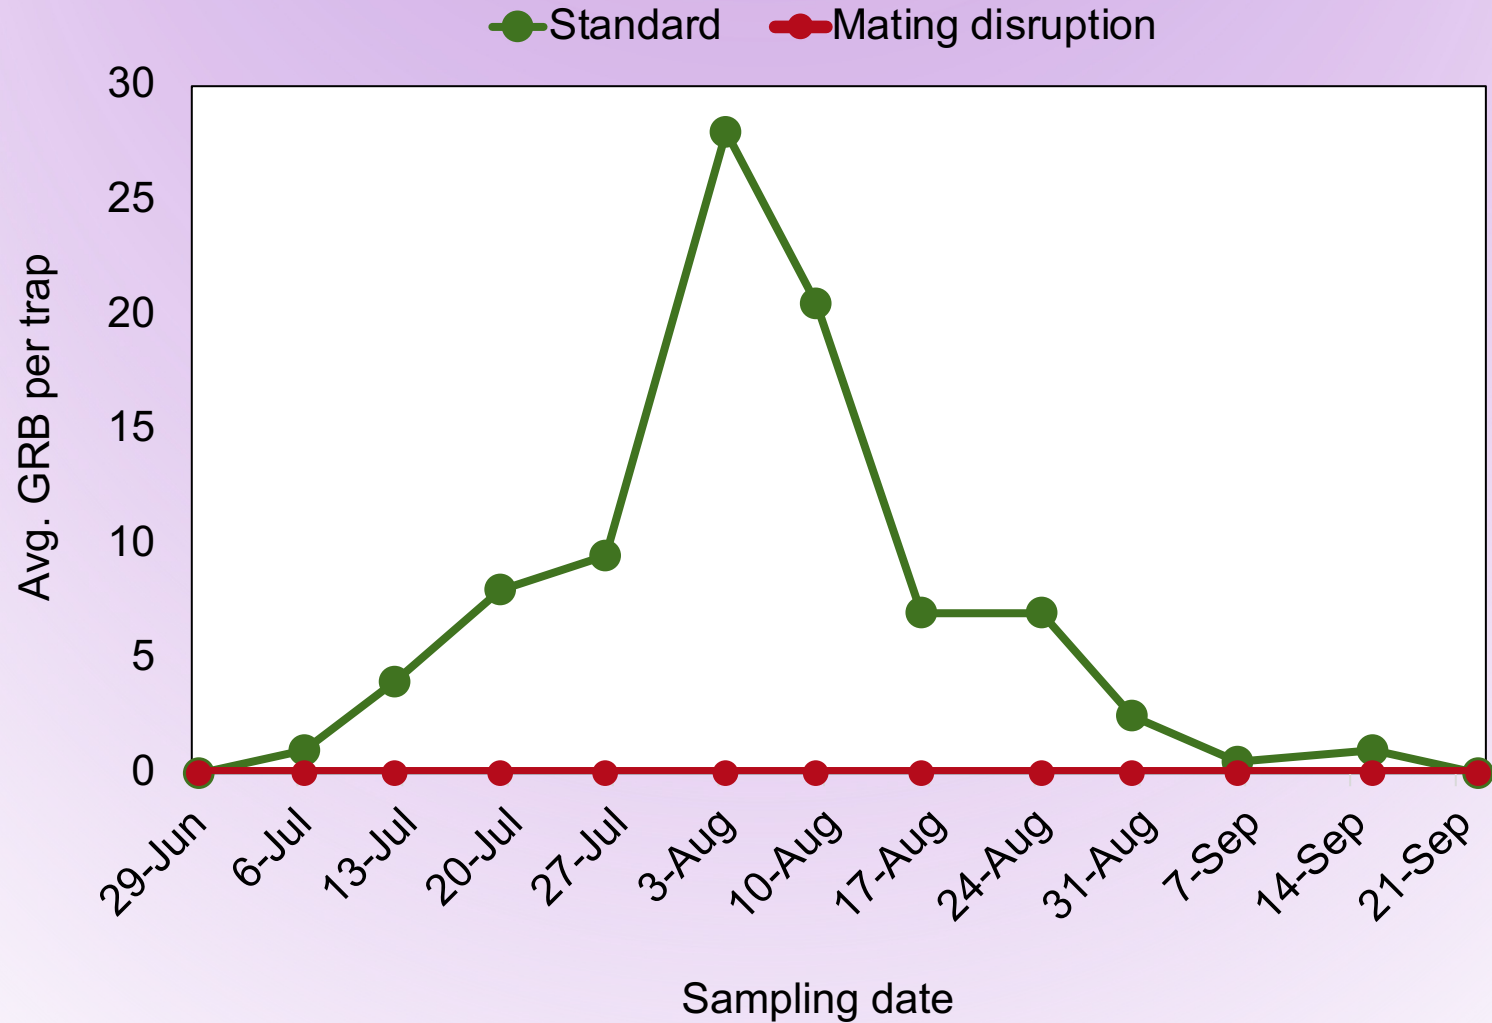

Grape root borer monitoring

- Bucket trap and pheromone
 - 1 trap per 2 acres
 - Begin mid-June
 - Check traps weekly
- Check for pupal casings at vine base

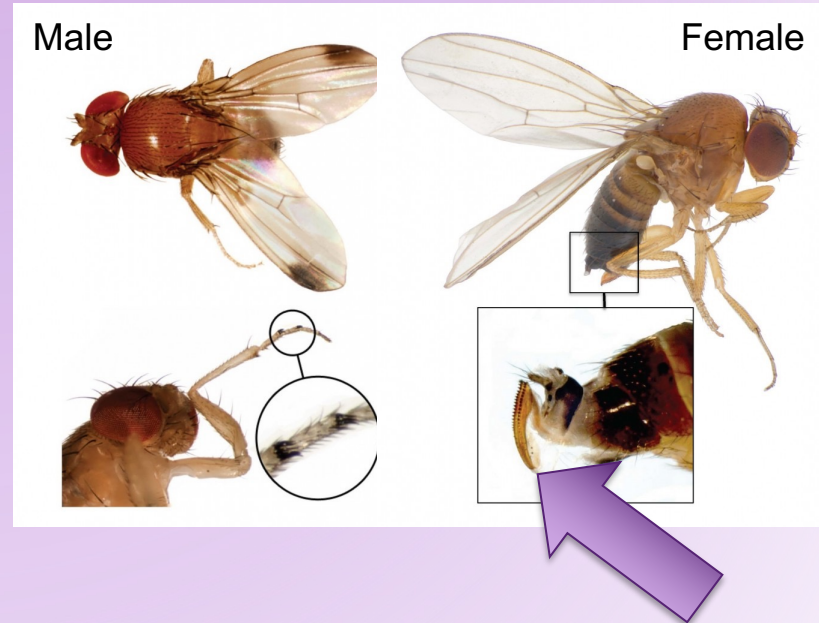

GRB activity

Spotted Wing Drosophila

- Vinegar (fruit) fly
- Adults are 0.07-0.13 in long, have red eyes
 - **Males** have a characteristic black spot on the tip of each wing
 - **Females** have a saw-like, ovipositor
- Hosts include blackberries, blueberries, cherries, peaches, pears, plums, strawberries, raspberries, and **grapes**
- Lay eggs in ripening fruit
 - Can transmit sour rot
 - Larvae feed and pupate within fruit
 - Full life cycle as quick as 9 days
- Larvae may infest fruit at harvest
- Monitoring and management are crucial

Monitoring for SWD

- SWD is attracted to many volatiles
 - Including vinegar, wine, yeast, and fruit
- Bait for traps
 - 1 tbsp dry yeast, 4 tbsp white sugar, and 2 cups of water + unscented dish soap
 - Solution should be 1–2 inches in trap
 - Traps can be made from plastic containers with 6 to 12, 3/16-inch-diameter holes about 2/3 around
- Commercial lures and traps are available
- Deploy traps 2 weeks before fruit begins to color
- Place traps on the north side of rows at fruit level

Checking Fruit for Larvae

- Larvae may be present in fruit before adults are caught in traps
 - Also indicates whether sprays are effective
- Collect intact, ripening grapes
 - Place fruit in a flat, dark pan or zip-lock bag
 - Add a salt solution (**1/4 cup salt to 4 cups water**)
 - Wait ~15 minutes for larvae to exit the fruit
 - Larvae found in recently ripened fruit are likely to be SWD

Timing of insect activity in the field

Bud swell through budbreak

- Grape flea beetle

- Mealybugs

- Leafhoppers/sharpshooters
(for Pierce's disease suppression)

Prebloom

- Grape flea beetle
- Leafhopper/ sharpshooters
- Grape berry moth

Bloom

- Thrips

Fruit set

- Leafhopper/ sharpshooters
- Grape berry moth
- Grape phylloxera
- Mites

Cover sprays

Peppercorn to veraison

- Leafhopper/ sharpshooters
- Grape berry moth
- Grape phylloxera
- Mites
- Japanese beetles

Mid-May to Early-June

- Grape root borer (mating disruption)

Veraison – 15° brix

- Spotted wing drosophila

Plus:

- Leafhopper/ sharpshooters
- Grape berry moth
- Mites
- Japanese and June beetles

Pre-harvest – at least 35 days

- Grape root borer

Plus:

- Leafhopper/ sharpshooters
- Grape berry moth
- Mites
- Japanese beetles
